Abstract—This document presents a short system-level test plan for the Collaborative Study Material and Quiz Platform. The tests validate the main user flow from login to study-material access and quiz submission.

Keywords—system testing, study material, quiz, user role

I. Introduction

System testing checks the complete application against expected user behavior. The scope includes authentication, role-based access, material search, quiz completion, and score display.

II. Test Environment

The test uses the project application, SQLite database, a web browser, and sample Student and Admin accounts. Testing is performed on a local machine.

III. System Test Cases

ID	Scenario	Expected Result	Status
ST-01	Student logs in with valid credentials	Student home page opens	Pass
ST-02	Student searches for a material	Matching materials are listed	Pass
ST-03	Student submits a quiz	Score is calculated and shown	Pass
ST-04	Admin opens management view	Admin controls are visible	Pass

IV. Conclusion

The sample end-to-end scenarios pass. Further system testing can include invalid inputs, concurrent users, and larger material libraries.
