Abstract—This document describes short integration tests for interactions between the authentication layer, database, quiz services, and application workflow.

I. Introduction

Integration testing verifies that connected modules exchange data correctly. The main interfaces considered are authentication with the database, quiz services with stored questions, and score history with submitted attempts.

II. Integration Test Cases

ID	Modules	Test Action	Status
IT-01	auth + database	Register and authenticate a student	PASS
IT-02	services + database	Create question and quiz	PASS
IT-03	quiz + attempts	Submit selected answers	PASS
IT-04	materials + database	Upload and search a material	PASS

III. Test Data and Procedure

Use temporary users, one sample question, one quiz, and one study file. Initialize the database, execute each workflow in order, verify database records and returned values, and remove temporary data after testing.

IV. Conclusion

The integration tests confirm the basic flow between the platform's main modules. Additional tests may cover duplicate users, missing files, and database failures.
